i know modifyct but the problem is always there:
you have to type in manually all the triplets. if i have to type in
the triplets,
i can do that: i write a text file with the triplets, read them and
load em with tvlct and i also avoid the problem of updating or writing
a new tlb file...

i simply expect xpalette to have a button with SAVE and then i type in
a color table number, say 41, and then i load it with loadct...

the problem is that typing the triplets in is time consuming...
or , another way to solve the problem,
is there a way to get the triplets automatically from xpalette to be
used in modifyct?
