
Subject: Help displaying live video

I have a Windows program that is capturing live video. I would like to integrate the live video into an IDL program, so I am changing the Windows program to be a DLM.

On the IDL side, how should I interface to the DLM and display the video. I assume I will create a pointer and pass it to the DLM, but to what should the pointer point and how should I display it.

The images currently are single plane 24-bit monochrome data of which only 8 bits are used. I can change that if necessary in the DLM.

Thanks in advance,
