I have had some problems (actually it appears to be a bug) with reading VMS unformatted
FORTRAN files and using the ASSOC() function. I have a 3-dimensional real*4 unformatted
file and ASSOC with a variable. When I try to access a record I get an erro to the effect
of INVALID FORMAT FOR USE WITH ASSOC. This works with unformattd byte files but
not with real*4; and yes, I tried the SEGMENTED option. This has been reported. Has
any one else noticed this problem? (I am using PVWAVE 3.03 on VMS 5.4)
