(Sorry if it is a faw)

I've spend days of dubbunging and then I've found that, on 5IDL.2:

```
IDL> a=intarr(4)
```

```
IDL> a(4)=1
```

```
% Attempt to subscript A with <INT ( 4)> is out of range.
```

```
% Execution halted at: $MAIN$
```

```
IDL> a([4])=1
```

```
IDL> print, a(3)
```

```
1
```

Isn't it strange? Maybe it is reported somewhere in some idl guide, but I still can't believe

it is real....

Alex
