You're using the COM object model to access Matlab from IDL. The idea behind COM is that it exposes Matlab objects to programmers, regardless of what language they're using. So, for example, you could try to make these same calls to Matlab in VB (maybe even an excel macro, which is VBA), PERL, python, etc. and see if the calls to Matlab work in those languages. The reason I suggest this is b/c I tried to make IDL talk to Excel a while back using COM, and got a weird error that I could never figure out. The same calls worked fine in both PERL and VB, so I concluded that IDL was screwing up when making COM calls. You might try the same thing. Good luck.
