
Subject: IDL filled contour to PostScript - wired horizontal and vertical lines ???

Hello,

I have been looking through the whole web whether anyone else has ever experienced this before but I could not find anything. I do a filled color contour plot of regular data on a map projection which looks perfect in the windows display. However, when I plot the contours to the postscript device then the filled contours look fine as well with the exception that I have some vertical and horizontal lines with regular spacing over the area that is covered by the contours. These lines have all the same color (in my case light blue). Does anyone knows the answer to this? I really would like to get rid of them.

Cheers,
Sebastian
