
Subject: uniform expansion

Hello,

Say I have a random 2D shape (a blob) with an irregular border (all pixel values equal to one). What I want to do is uniformly expand it in all directions such that it's increased by a constant integer number of pixels all around the perimeter. Subtraction of the original shape from the new one should yield a thin border with a constant width corresponding to the # of pixels the object was enlarged by.

Does anyone have any suggestions... preferably of an IDL nature?

Regards,
Mark
