This is where I shamelessly plug my "dlmform" perl script that in many cases can do the whole job for you, including taking a scalar FORTRAN routine and make it available as an IDL function that eats and spits out arrays.

See <http://www.astro.uio.no/~steinhh/idl/dlmform.html>

It's been a while since I used it, it may need a little bit of updating for newer IDL versions. Contact me directly if you have problems (though I give no guarantees on response time!!!).
