
Subject: Complex arguments in Bessel functions

I am attempting to solve an equation in IDL which involves Modified Bessel Functions (using a simple root finding algorithm(newtons method)). The roots to the equation however are complex and IDL's 'beselK(argument, order)' function ignores imaginary numbers when entered so for example gives: $\text{beselK}(1,0) = \text{beselK}(1+i,0)$ and $\text{beselK}(i,0)$ gives an error since $K(x,0) \rightarrow \text{inf. as } x \rightarrow \text{inf.}$

Q: Does anyone know if there is an easy way round this....or, in fact, any way round it at all?

Thanks,

Ben Carter
