Hello,

I use the following code to read an ascii file:

```
> filename = dialog_pickfile(path='c:\')  
> data = READ_ASCII(filename, DATA_START=1, DELIMITER= ',')  
> data = data.field1
```

I want data to become an array instead of a structure.

The problem is that sometimes the array is contained in field01,
sometimes in field01.

How come it varies ?

Thanks,

Francois.
