A follow up to my posted problem:

Maybe I can pin down the problem (thanks to Bill Thompson who put me on the right track). Under windows IDL allocates only 236 colors. Therefore XPALETTE allows only to change these. Upon later recall of the saved table LOADCT interpolates from 255 to the 236 available colors and thereby includes unchanged values lying above 236.

I don't yet see a solution to this logical problem.
