I have never been good with figuring out how all the date formatting stuff works. I want to label the X axis on a few of my plots with some readable date strings. In certain cases, I'd like to display something of the form "HH:MM:SS". Other times I'd like to see a day of month or a day of year or some other variation.

Anyway, assuming that I have a timestamp in the form of seconds since the 1970 epoch, is there some built-in way to convert to the time string I'm choosing? Or will I have to write my own conversions? Secondly, how do I go about cleanly setting the labels on my IDLgrAxis to the strings?

TIA,  
Mike
