Hi everybody.

I have some problems with date formats.

The function FILE_INFO returns me a structure containing access time, creation time and modification time (and other fields...). Those dates are given in UNIX time, but i need this information in julian time.

This is my solution:

```
result=FILE_INFO(file)
modification=julday(1,1,1970,0)+(result.mtime/60d/60d/24d)
```

...but I hope for somebody than knows any 'more elegant' way to do this.

Thanks.

DLo.
