IDL_line_profiling-1.0 is available from
http://www.hmet.net/software/IDL_line_profiling/

Line profiling determines the amount of time spent executing each line of code.

IDL has a PROFILE tool, but it only determines the amount of time spent in each function or procedure. It doesn't resolve the time spent on each line.

Included are the necessary scripts and procedures to perform line profiling on IDL code.

NOTE: This is a very young version. It makes assumptions about the source code file that may not always be true (see README but it should be easy to alter the source code to conform to the expectations. As the code matures, it will become more robust. I hope.
