Hi everybody!

I have written an algorithm that is sequentially analysing structures within 2d-datasets. The program is running nicely, however not very comfortably with several decisions/parameters having to be put in via little windows.

I tried to get the entire concept into a widget based structure, but, as

I have to admit, did not get very far within the last week trying to make use of the IDL documentation. My question: Is there a comprehensive introduction into widget structure in IDL available somewhere giving better insight than the IDL documentation?

Thanks to everyone for a good advice.

Mat
