: I have a frame grabber card and a black and white camera. The frame grabber
: digitizes an image to 8 bits and saves to a binary file that I read with the
: following commands:

```
: a=bytarr(320,240)
: openr,lun,'image1.img',/get_lun
: readu,lun,a
```

: This image looks fine when I type: tv,a

: I now want to save to a GIF file so that I can view the image on a PC
: using the DOS viewer QPEG. IDL can do this by using the command:

```
: write_gif,a,'image1.gif'
```

: This seems to work fine because when I type the commands

```
: read_gif,'image1.gif',b
: tv,b
```

: the image looks like the original.

: The problem is that when I look at the same GIF file on a PC with the
: DOS viewer QPEG, it looks terrible. The image is still there but now it
: is mostly white.

: Has anybody else ever had this problem??

My guess is that the color table is not save properly with
the image.

Maybe you could try this after loading and viewing the
image:

```
...
tv, a
```

```
TVLCT, r, g, b, /GET           ;Get current color table
WRITE_GIF, a, 'image1.gif', r, g, b      ;Save image w/ color table
```

Hope this helps.
