If you already have ENVI, you should use the additional ENVI libraries that RSI provides for faster opening and closing of files (envi_open_file,envi_file_query, and envi_get_slice are my favorites). You need to read the ENVI documentation, NOT the IDL documentation to find these additional libraries.

If you are moving to a system that has IDL but NOT ENVI installed, you are stuck with low-level access: openr and openw, assuming you know all of the number types and endian, etc, etc.
