
Subject: Aggregating an array

Hello,

I try to aggregate an two dimentional array to calculate statistics on sub-arrays.

I thought I could use vectors to define subscripts to use the mean() function :

```
res = mean(data(x:x+i,y:y+i))  
  where x is a one-dimention array
```

but subscritps must be scalars.

I try to avoid loops, but I don't see another way to do it. Does someone knows a solution for this problem ? Is there an existing function in the libraries that could do it ?

Many thanks for your help !

Jerome
