Hi all,

can't keyword passing by `_extra` be used with `call_method`? I am getting an error message "Keyword parameters not allowed in call" if I try to do so.

I want to write a wrapper routine which first checks if an object is valid, and if yes, calls methods on it. For positional parameters, I have to use "case `n_params()` of", which is not very nice, but for keywords at least I would like to use inheritance...

Any hints? Thanks,

Benjamin
