---

I have been using idlwave in emacs on sunos and irix systems for years.

Now I am trying to use it on a linux box. idl is working properly from the command line, I can even run it in a shell window in emacs, but if I try to run idl as an inferior process in idlwave mode, I get the following messages:

IDL Version 6.1 (linux x86 m32). (c) 2004, Research Systems, Inc.

Process idl hangup

Any suggestions?
