Very cool.

I downloaded it and tried it on my linux box:

IDL> print, !version
{ x86 linux unix linux 6.0.3 Feb 26 2004   32   64}

and I note that the little "+/-" icons next to directories don't work. That is, the only
way I can look at the contents of a subdirectory is enter it via a double-click. The
little manila-folder subdirectory icons do open and close when I single-click the "+/-"
bitties, but there is no display of files. (Does this explanation even make sense?)

I dunno if it's a unix/windows thing.
