I'm very new to IDL, so I apologize if this is simple problem. I'm doing research involving infrared images of Mars. A graph of pixel saturation will be linear then go cubic to a zero slope as it saturates. However, the test in the program we run doesn't seem to work with some images that were given extra current. What I'd like to do is test the slope of the tangent line until it goes towards zero for saturation, however I'm not sure how to do this and I can't make heads or tails of the help file on DERIV or anything else I think would be helpful. The fit is being taken with polyfit. I appreciate any help, and I'm sorry if that was extremely vague.
