Subject: how to rerun subroutine only?

---

this is probably a beginner question, so I appreciate your patience:

Suppose I compile & run a top level program, then it enters a subroutine. Then suppose I want the code to stop somewhere in the subroutine so I can plot variables or check on/plot the results of a calculation... or say the subroutine encounters an error. then I might change something in the subroutine and need to rerun the subroutine.

right now I recompile the subroutine then rerun the entire code starting from the beginning of the toplevel program, when all I really need to do is have idl redo the calculations from the beginning of the subroutine.

is there a way to do this?

thanks in advance for your time!
