---

Folks,

I think I am beginning to understand how people feel when they start to learn about objects for the first time.

That is to say, the IDL documentation is just about impossible.

I'm trying to get up to speed on XML files very quickly (that is, I needed this yesterday). I'm looking at the documentation and my anxiety is increasing exponentially. Does anyone have a fairly simple example of reading an XML file and doing something useful with the information?

I would like, for example, to read a configuration file with parameters and their associated values. I would like to build a widget that would allow the user to change the values, and finally I would like to write the configuration file back to an XML file. Does anyone have anything remotely like that?

I see to be floundering in IDLffDOM minutiae. :-(

Cheers,

David
