To extract a subimage (partial area) in ENVI, just go to file - Save File AS - ENVI standard.....and then do a spatial subset. If you click on the subset by image button you can draw a rectangle on the image that represents the subimage you'd like to extract.

What do you mean by full resolution? Do you mean have a display that shows the entire window (since envi's display windows usually only show you part of it by default)? If thats what you mean, i usually just resize the scroll window to get the desired effect.
