
Subject: integer operations in IDL

hello -

there are integer operations in windows API which I find really speed calculations on large data sets, for example UInt32x32To64

The UInt32x32To64 function multiplies two unsigned 32-bit integers, returning an unsigned 64-bit integer result. The function performs optimally on 32-bit Windows.

Is there anything comprable in IDL? Or does anyone have a suggestion on how to implement it?

thanks,
