David's questions got me curious, so I spent a lot of time this afternoon wading through the IDL documentation for it's XML objects. At the end of that survey, I still couldn't figure out how to use a DTD in connection with those objects. There's lots of things that say "if a DTD is provided", but I couldn't find anything that indicated how to provide a DTD. Could someone give some actual IDL code for this?
