as concatenation, yes, but not as subscripting. The IDL reference guide says:

#### Operator Precedence

The following table lists IDL's operator precedence. Operators with the highest precedence are evaluated first. Operators with equal precedence are evaluated from left to right.

Priority	Operator
First (highest)	( ) (parentheses, to group expressions) [ ] (brackets, to concatenate arrays)
Second	. (structure field dereference) [ ] (brackets, to subscript an array) ( ) (parentheses, used in a function call)
Third	* (pointer dereference)
.	
.	
.	

so my original question still holds.

regards,  
lajos
