The IDLWAVE is really what I want for such a long time in the terminals.

But when I work throung the tutorial, I cannot make it work in Xemacs, for such M-TAB to show the routine info, and plot_ + "TAB" to autocomplete the command line

in shell. However, I can make it in emacs. I use the pre-compiled idlwave-xemacs package.

And I have to disable the CTRL+TAB, ALT+TAB in KDE, which is used to switch the windows

in KDE by default. How can one make IDLWAVE work in Xemacs just as in emacs? Thanks!
