I am having a problem with the IDL-Java bridge and JDBC. I am using IDL 6.1 on Windows 2000 and have written a small java program that registers an Oracle driver and inserts a record. It works fine with a "test" main function in my java app, but in an IDL session, the Oracle driver is never found. I am using the default idljavabrc file and setting my CLASSPATH environment variable to point to my java class' jar file and the Oracle JDBC zip file. Thanks.
