Hi group,

I have a little problem with my idlwave-mode.

I have defined on my .bashrc and .bash_profile file the IDL_PATH environment variable to point IDL directories and another personal directory with some routines.

The problem is:

- If I open a GNOME-terminal and execute emacs (into X) then all is ok.

I can execute the programs that execute my personal routines.

- If I execute Emcas directly from a launcher icon the !PATH variable not contains my personal directory.

Any idea, thanks.

Antonio.

PS: I find other old messages but any resolve this little problem. Also if I execute:

```
IDL> print, getenv('IDL_PATH')
```

The result is an empty string :(
