Options, in decreasing order of preference:

- Put Linux on your box;). As a bonus, in addition to getting IDLWAVE's most supported environment, you'll be able to allocate much more memory under Linux IDL than Windows IDL on the same system.
- 2) Buy a Mac. IDLWAVE works well under OSX, which has a capable BSD-derived Unix layer, and an X11-based Unix IDL. You'll still be able to use your Microsoft products too.
- 3) Beg RSI for a Windows command line IDL. IDLWAVE works fine under Windows with Emacs, it just has no IDL shell to communicate with.
- 4) Use IDLWAVE as your editor, and IDLDE to compile. I know a few people do this, but I'm not sure what the easiest work-flow is (anyone?).
