Hi

I'm running IDL on suse linux. Right now, I have my /etc/init.d/ scripts set up to shut down the IDL license manager when I shutdown the computer (ie. I have a script in /etc/init.d/rc0.d/). ...Is there any reason to shut down the license manager? It seems to me it is pointless, and it ends up making my computer take a long time to shut down!

Thanks,
Sean
