
Subject: Executing with classes dependencies

Hello boys,

I think my first release of IDLCanvas is almost finished. Now I'm writting some code examples.

I try to put in the !PATH variable the path to the IDLCanvas classes (thinking it will compile automatically) but this doesnt work. When I execute the example it fails (the error is not significant, only says that the number of initalization parameters for one class is not right). On the other side, if I execute the same example compiling before all needed classes all is right.

Any idea from you?

Thanks.
