
Subject: How to display one image with different color tables?

Hello, Could you give me some help on the following problem --
I want to use different color tables to display different parts of an image. My image (intarr(700*700)) includes 3 parts: ocean (=999), land(=900), several ROIs on land (=0~100). I'd like my ocean to be white, land to be yellow, and ROIs to be displayed using the Blue-red color table.

I've been trying for sometime with no luck. Could you give me some hints or at least tell me is it possible with IDL direct graphics?

Thank you in advance,
Jenny
