I use a similar approach with several WWW-based data systems that invoke perl scripts via a HTML form. The perl script executes IDL in batch mode, runs a IDL routine to make a plot of the selected parameters, and writes the results to a GIF.

The output is then display on the WWW browser as a HTML document with an inline GIF image.

Examples of various perl programs that use IDL on the web and the corresponding HTML forms are available via the following URL: <http://coney.gsfc.nasa.gov/Mathews/misc/idl-www.html>
