Hi,I'm a new guy for IDL.I want to call a fortran routine from idl.The guide of the IDL tell me that the easy way is by using call_external. It seems that most examples are under unix or other OS. When I call fortran code via C wrapper,I does not know how to get the "example.dll"(I try to run the 'example_c2f.c' from the external development guide,but fail). I use IDL6.0 under win2000. I hope to get some detailed examples on win.Thanks
