  It has been quite a while since I dealt with Dataminer, but as I
recall we would see this when one of the following was true:

 - The Oracle server was not accepting connections (from anyone)
 - The odbc.ini file was in the wrong place and therefore was not
   being read.
 - An old odbc.ini in the user's home directory was being read,
   instead of the system default (or vice versa)
