I am trying to extract specific values from an array, datax (string array[1,300]).

When I type the command

print,datax GE 100

it works fine and it gives me the correct answer. But when I type

print,datax GE x

where x has been defined in the program earlier as 100 and is an integer array[1]

the result is -1 which is wrong since there are values in this array that are greater or equal than 100.

Does anyone have an idea what is going on?

Thank you, Angela
