I suspect what you want can't be done. If you take the simple code
below, 'A' appears in the variable list even though the line has never
and can never be executed.

```
 pro test

   goto, avoidvariable
   a=10
   avoidvariable:

 end

 IDL> .run test
   % Compiled module: TEST.
 IDL> print, routine_info('test', /var)
       A
 IDL>
```
