Subject: problem restoring a save file from within a procedure Posted by Hrafnkell on Thu, 09 Jun 2005 14:43:46 GMT

Hi

My problem is that I can't restore .sav files from within a procedure. There are three restore commands whitin my procedure, each one for a different .sav file. Each .sav file contains only one variable (none of them with the same name). The three restore commands are the only commands in the procedure.

So my procedure looks like this:

PRO plotprecip restore, 'fullpath1' restore, 'fullpath2' restore, 'fullpath3'

END

When I run the procedure IDL doesn't issue an error command, but the variables aren't restored. The variables are deffinately in the .sav files because when I restore them from the command line IDL recognizes the variable whitin them. The problem seems to be windows. When I ran the procedure on a linux machine everything went fine. Is this a known bug?

Any help appreciated, Hrafnkell
