Ooops...

I've just noticed that your last variable: '-doy' is not an array,
while all the other 5 are. Is that right?

I think in this case what I've said above will not work either.

I am not aware of what Ben told you above, but if that does not work
either, ...here is another idea...

Why do not you save the "doy" variable separately from the other data?

I mean, something like:

```
openw,1,fileout
printf,1,doy
for m=0,M-1 do begin
  printf,1,data[0,m],data[1,m],data[2,m],-data[3,m],data[4,m],data[5,m]
endfor
close,1
```
