Hi Chris,

Thank you for your valuable suggestion that makes my program much faster.

I am coming from C++ programming background. So I'm new to IDL. While learning IDL I came to know that LOOPS are making program much slower, so instead of loops one should use the direct array operation that are provided by IDL,

I have even checked out with some examples, that loops will make your program slower.

But I'm thinking that while processing with array internally it is using loops, but in much faster way, I tried to find this answer, but I do not get success. I have some compiler designing concept and autometa theory concept. So if you have some idea then I would like to know about it.

With regards,
Chintan
