Hi,
I would like to add image registration to some of my medical applications software and ideally I would like to make use of the National Library of Medicine Insight Segmentation and Registration Toolkit (ITK) which is freely available. We have used this toolkit from a Python/VTK based environment before but we have no experience of calling the routines directly from IDL.
Has anyone already figured out how to do this already? I could just used SPAWN to call an external program but I would prefer to figure out how to pass image data from IDL memory directly.

Thanks,
Anne
