Subject: Reading and Writing Files

Posted by pravesh.subramanian on Tue, 30 Aug 2005 19:51:58 GMT

Hello,

I am having trouble with openU command. I have some text present in a
file and if I update that file with this command, the existing text
gets overwritten!
Now, I guess the way out would be to get the point_lun command to push
the pointer to the end of the file so that there is no overwriting.
How do I set it to end of the file?

Another question regarding files is: after I have updated a file by
running the update program, I would still get a message saying file is
being used by another user (read-only mode) though I am careful enough
to do a free_lun after using the lun. What could be wrong?

What would be the worst thing to do to make image display using tvscl
go wrong?? I keep getting images in these wrong colors. By default, it
is supposed to be yellow but it sometimes shows red and sometimes No
color. I have the color table at top = topclr - 1

Thanks for all the help!
