
Subject: IDL VM crash

Hi,

I'm running this kind of code:

```
pData=objarr(MaxGray+1,/NOZERO)      ;array van linked lists  
for i=2,MaxGray do pData[i] = obj_new('LinkedList') ;yes, the one  
from David
```

...stuff...

obj_destroy, pData ;crash point?

This goes ok 1000 times in IDL (6.0 under Win2K). Then I make a .sav file - runs ok in IDL-runtime. But when I open the sav file under the IDL-virtual machine it sometimes crashes. It is reproducible - it always crashes on the same data. This looks like a VM bug - is there any way around this?

regards,

Gert
