Subject: Re: How to create an image from the last columns of a stack of images?
Posted by cgguido on Fri, 09 Sep 2005 15:10:57 GMT

Not sure I get your question 100%. But if you have an image cube A so
that
idl> help, A
A   something_array[1920, 1080, 3000]

and you want to create a 2D image from the 1920th slice along the first
index then it's as simplle as
idl> b=a[1919, *, *]

this is !very! simple though, so I really think you mean something
else. could you clarify your question, perhaps with a small example?

thanks,
Gianguido
