I suppose I should also point out that I can already make this work....in fact the person that asked me for help already had it working....I just need to make it work in a way that doesn't take 4 days now :)

I can post you two versions of code if it'll help: one is the original code by the person that asked me for help, and the second is what I came up with using ENVI tiling routines.

I think that the problem is that i'm trying to move around columns of data, which aren't in contiguous locations on disk, and its the read times that are killing me.
