Hi everyone, my post might have been not detailed enough. Let me restate it in a little more detail: I am able to save a 3D image in postscript format, but I want to be able to select the axis, labels.. each component individually in illustrator and modify it. My postscript image so far only looks like a jpeg image and I have no way to select all the component of the image. Does anyone know what option I will need to set to have the postscript image able to have its components modified at will in Illustrator?

Some helpers suggested to use the VECTOR keyword if I used IDLgrClipboard in my implementation, however I used IDLgrModel and IDL\_Container in my implementation. How should I use the VECTOR keyword or related functionalities to get each component of the postscript selected? Thank you.
