I also noticed these widget convulsions in IDL v3.6. When I tried to add a new child widget to an existing parent, IDL did not put it on top of an existing child, but the parent sort of 'flashed' multiple times as the new child was added (the child was a multi-line text widget, and IDL would add the first line, then rebuild the widget to make room for the second line, add it, rebuild for the third line... well, you get the idea). This gave a flashing or convulsing effect that was VERY slow. I finally just manipulated how I built the original parent until the problem disappeared.
